anthropia broth wwmll Que-1 DFS Solhi · Stands for Breadth first · Stands for Depth for Search Search . It was stack to · DFS uses quere to find shortest path. find the shortest both · DFS is better when · BFS is better when - target is far from
source.

DES is more suitable target 9s closer to source · As BFS consider all for Declslon free. As with neighbours soft is not one decision we need to suitable for decision tree used in puzzle games traverse further to · BFS is slower than argument the decision. If we seased the conclusion. DFS

Application of DFS

· Using DFS we can find path between two vestices.

• We can perform topological sorting which is used to scheduling jobs.

scheauung juss.

The can use DFS to detect cycles

Using DFS, we can find strongly connected components

- Application of BFS:

 BFS may also used to detect ycles

 finding shortest path and minimal spanning tree in
- · In metworking finding a mute for packet transmission.

 finding a mute through GPS navigation system.

Structure. In BFS you mark any node in the graph as source node and start I traversing from H. BFS traverson all the nodes in the graph and keeps dropping them as completed. BFS visited an adjacent unvisited mode, marks it as done and insert into Queue. land togeth of both and all him at

DFS uses stack data structure becaux Dfs traverse a graph in a depthward motion and uses a stack to remember to get the next vertext to start a search, when a dead end occurs in any iteration.

Solt Spasse Goophis A graph in which the number of edges is much less than the possible number of edges.

Dense Goophs: A dense Craph is a graph in which the number of edges is close to the maximal no of edges of edges.

The graph is sparse, we should store it as list of edges.

Alternatively it a graph is dense, we should store it as a distance of edges.

Solm DFS can be used to detect cycle in a Graph.

DFS for a connected graph produces a tree. There is a cycle in a graph only if those is a cycle in a graph. A back edge is an edge that is from a node to itself or one of its ancestor in the tree produced by DFS.

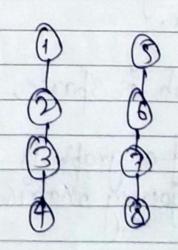

BFS can also be used to detect cycles. Just perform BFS while keeping a list of previous nodes at each visited or else constructing a tree from the starting node.

If I visit a node that is already marked by BFS, I found a cycle;

Som Disjoint set Data Structure:

In the same set or not efficiently.

A disjoint set can be defined as the subsets when there is no common element between the two sets.

operations performed:

(i) find.

Solm: Algorithms that was Priority Quew:

(i) Dijkstra's shortest both Algorithm using priority Queue.

When graph ix sorted in the form of list or

matrix, priority queue can be used to extract

minimum efficiency when implementing Dijsktra's Algorithm

(ii) frim's Algorithm: It is used to implement frims algorithm to store key of nodes to extract minimum key node at every step.

(iii) Data compression: 9+ is used in Huffman's code which is used to compress data.

Soln of Min heap the fey of max-head the fey present present at not node must be at not node must be agreed to or less than or equal to among the equal to the fey present at all the shildow its childrens:

I less the ascending priority of the maximum fey present at the root node.
